How Our Smart Features Actually Work

A straightforward breakdown for Organizers, Guests, and Vendors

Prepared by: Osama Morad

Let's talk about how this actually works.

Mudyaf is already a fantastic tool for connecting organizers, guests, and vendors. But we want to take it a step further. We want the platform to actually help you run the event, not just display information about it.

To do that, we are adding a layer of intelligence that anticipates problems before they happen, guides guests smoothly through their journey, and helps vendors know exactly what to do. I've broken down exactly how these new features work behind the scenes, and what they feel like for the people actually using the app.

I. What this means for Organizers

1. The Live Command Center

Instead of constantly calling drivers or checking spreadsheets, we want organizers to have a single, living overview of where everyone is right now.

How it works behind the scenes

The system constantly gathers data from a few different places at once. It watches live flight statuses, pulls current traffic conditions from Google Maps, and checks the driver's GPS location every ten seconds. It also connects directly to the QR scanners at your check-in desks.

It then puts all those puzzle pieces together. If it sees that a flight landed 30 minutes ago, but the assigned driver is still 15 minutes away from the airport, the system instantly flags that guest as 'At Risk' of waiting too long. It calculates a precise, realistic arrival time for everyone in transit, so you know exactly when they will walk through the hotel doors.

Here is what that looks like in real life:

Imagine you are looking at the organizer dashboard. You notice Terminal 2 is flashing amber. The system tells you: 'Warning: Three delayed flights just landed at the same time. 40 guests need pickup soon, but we only have 15 vans assigned there. Should we divert 5 vans from Terminal 1?' You just tap 'Yes', and the drivers get their new instructions instantly.

2. The Smart Assistant

When you are in the middle of running an event, you don't have time to sit down and run complex filters on a database. You just want to ask a question and get an answer.

How it works behind the scenes

We built a natural language interface into the app. When you type or speak a question — in English or Arabic — the system understands what you mean. It takes your everyday language and safely translates it into a database query. It finds the exact numbers you need, and then replies to you in a normal, conversational way, even suggesting the next logical step.

Here is what that looks like in real life:

You speak into your phone: 'Which vendors are missing from Hall A right now?' The app quickly checks the geofence logs and replies: 'Only the AV team is missing. Their GPS shows they are stuck in traffic about 10 minutes away. Do you want me to send them a message?'

3. Automated Post-Event Reports

When the event is over, nobody wants to spend two weeks manually crunching numbers to figure out what went wrong. We want the system to do that for you instantly.

How it works behind the scenes

The minute your event officially ends, the system gathers all the logs: how long guests waited at the airport, how much time drivers spent sitting idle, and what the survey scores looked like. It then scans all that data looking for patterns. It notices things a human might miss — like the fact that long wait times at Terminal 2 directly caused lower satisfaction scores at a specific hotel.

Finally, it writes up a clear, easy-to-read executive summary, complete with charts, so you can see exactly what happened and how to fix it next time.

Here is what that looks like in real life:

The morning after your event finishes, you wake up to a beautifully formatted PDF in your inbox. You open it, and it says: 'Drivers spent 40% of their time sitting idle at the hotel yesterday afternoon. If we group guests together more efficiently next year, we can cut fleet costs by 25% without making anyone wait longer.'

II. What this means for Guests

1. Frictionless Driver Matching

We want to completely eliminate the anxiety guests feel when they land in a new city and don't know who is picking them up or where to go.

How it works behind the scenes

Before the flights even touch down, the system looks at everyone arriving around the same time. It automatically groups guests heading to the same hotel and assigns the right-sized vehicle. Then, it watches the driver's GPS. The moment the driver gets within 2 kilometers of the airport, the system automatically sends a push notification to the guest.

Here is what that looks like in real life:

A guest lands, turns off airplane mode, and immediately sees a message on their screen: 'Welcome to Riyadh! Your driver Khaled is waiting at Exit 4 in a white GMC (Plate 8899).' They open the app, see Khaled's exact location on the map, and walk straight to the car. No phone calls, no confusion.

2. The Personal Digital Concierge

Events are chaotic, and schedules change. We want guests to feel guided and cared for, no matter what happens behind the scenes.

How it works behind the scenes

The app constantly watches the organizer's master schedule. If a dinner is pushed back by 30 minutes, the app instantly updates the personal itinerary of every guest attending that dinner. It also looks at where the guest is standing right now, checks the traffic, and calculates exactly when they need to leave to make it on time.

Here is what that looks like in real life:

A guest is relaxing in their hotel room. The app sends a gentle reminder: 'The Keynote Speech starts in 45 minutes. Traffic is a bit heavy today, so we recommend heading down to the lobby shuttle in the next 10 minutes so you don't have to rush.' They arrive perfectly on time.

III. What this means for Vendors

1. Instant Document Approval

Onboarding vendors usually means drowning in paperwork. We want vendors to be able to upload their documents and get approved in seconds, without an organizer having to read a single page.

How it works behind the scenes

When a vendor uploads a picture of their commercial license or insurance, the system actually reads the document. It extracts the company name, the expiry dates, and the coverage amounts. It then checks those dates against the event dates. If everything is valid and up to date, it approves the vendor automatically.

Here is what that looks like in real life:

A lighting vendor uploads their insurance certificate at 2:00 AM. A minute later, the system replies: 'Sorry, your policy expires on October 12th, but our event runs until October 15th. Please upload an extended policy to continue.' The issue is caught and handled instantly.

2. Live Task Dispatching

Vendors shouldn't have to wait for things to go wrong before they react. We want the system to tell them exactly where they are needed, right when they are needed.

How it works behind the scenes

The system monitors how many guests are scanning into different areas. If it notices that Hall B is filling up much faster than expected, it realizes there is going to be a problem. It checks which vendor is responsible for catering in Hall B, and automatically sends a high-priority alert straight to that vendor's tablet.

Here is what that looks like in real life:

The head of catering is working in the kitchen when their tablet buzzes: 'Urgent: The coffee station in Hall B is getting really busy. Please send 2 more staff members and restock the pastries right now. Tap to confirm.' They tap confirm, send the staff, and the problem is solved before a single guest complains.

At the end of the day, these features do one simple thing: they let the technology handle the math, the tracking, and the logistics. This means organizers, drivers, and vendors can stop staring at spreadsheets and go back to doing what they do best — providing incredible hospitality.
